## AGROMETEOROLOGICAL BULLETIN

MAY 1980

### The Weather of May

The rather harsh and dry northeasterly airflow which had set in towards the end of April continued through into May. In the period from the 1st to the 6th the weather was dry and frost occurred on some nights. Changeable conditions on the 7th brought the first relief to the drought conditions with some outbreaks of rain occurring in many areas over the following days. The more persistent and heavier falls occurred in southwestern and western regions on the 10th and 11th. Much of the Midlands, eastern and northern regions received but little rainfall during this spell however. A return of the high pressure brought a further period of dry weather to all regions between the 14th and the 18th. This latter period was warm and fine and many inland stations had maximum afternoon temperatures in excess of 20°C on most days.

The second interruption to the dry weather proved to be more widespread. This interruption occurred on the 19th when weak warm frontal troughs became slow moving over the country. Some 7 to 9 mm of rain was recorded at most stations on the 19th and 20th, a small relief to the drought conditions which were already greatly retarding both the germination of seed and the growth of crops in all areas apart from in southern and some western districts. Nevertheless the dry weather returned again on the 21st and a spell of northerly winds set in as yet another ridge of high pressure developed to the north of Ireland. This latter spell was cool and temperatures fell to below normal although ground frost was not widespread during the period.

The weather became noticeably more unsettled towards the end of the month. A northwesterly airflow prevailed during this period and there were frequent showers or periods of rain in all regions. Thunderstorms occurred in the Midlands and East on the 26th and some of the showers on the 28th and 29th were of hail. Temperatures recovered to near normal by the end of the month.

Mean Monthly Amounts of Precipitation were well below normal everywhere for the second month in succession. Amounts ranged from 27% at Glenamoy to 66% at Dublin Airport and were less than 50% of normal over most of the country. Absolute drought conditions (periods of at least 15 consecutive days on none of which 0.2mm or more of rain fell) occurred at some stations in the Midlands and East from the last week of April to about 12th of May. Partial drought conditions (periods of 29 or more consecutive days during which the mean daily rainfall does not exceed 0.2 mm) affected most of the east and southeast from the middle of April to the third week in May. Soil moisture deficits at the end of the month were above average at all stations where measured except at Ballinamore and Glenamoy where it was below average. For most places however the deficit was some 50% greater than average. The incidence of weather suitable to the spread of potato blight and cereal diseases was well below normal.

Mean Monthly Air Temperatures were above normal everywhere except in southern and south Midland regions, ranging from 0.5°C below normal at Kilkenny to 0.7°C above normal at Malin Head. Soil temperatures (at 10cm) were generally above average by some 0.5°C at inland stations to 2.0°C near coasts.

Mean duration of Bright Sunshine was near normal, ranging from 92% of normal at Valentia to 120% at Clones.

The data contained in this Bulletin are provisional. Some of the material in Table 1 will be published in its final form later in the Monthly Weather Report; final values of Solar Radiation at stations; marked "e" in Table 2 will be published in the Annual Summary of Solar Radiation.
