## AGROMETEOROLOGICAL BULLETIN

APRIL 1981

### The Weather of April

High pressure dominated conditions from the 1st to the 9th. Apart from some showers on the 1st the weather was mostly dry and sunny except in the extreme southeast and south, where it proved to be very dull in this spell. Winds generally varied between southeast and northeast. Mean air temperature was near normal but ground frost occurred at night.

Spells of rain or drizzle occurred from the 10th to the 13th, and northeast winds were also strong and gusty on the 12th and 13th. Subsequently high pressure again became the dominant weather feature and continued to the 22nd. The period was dry, apart from a spell of rain in the west on the 17th, and it was sunny, especially from the 15th to 20th. Daily maximum temperatures were above normal except in eastern areas where cool onshore northeast winds dominated. Ground frost occurred on a number of nights.

A polar depression affected the country on the 23rd and 24th. Falls of sleet or snow lay on the ground for a spell over wide areas in the midlands, north and northwest. A cold northerly airflow, strong and gusty at times in the north and east, continued to the 27th. Ground frost occurred on most nights, which became sharp to severe in many places on the 26th. Mild weather returned on the 28th and there was rain at times in all areas, especially in western districts, up to the end of the month.

Monthly Amounts of Precipitation were well below normal everywhere except in the east. Most of the western half of the country received less than 50% of normal. Amounts varied from 24% of normal at Birr to 114% at Kinsealy, Co Dublin. The number of rain days was well below average. The most significant feature of the month was the wide-spread fall of snow on the 24th.

Mean Monthly Air Temperature was above normal everywhere except in areas near the east and south coasts. Values ranged from 0.7°C below normal at Casement to 0.9°C above normal at Shannon Airport. While the number of days with ground frost was below normal in the west and north midlands, the number in the east and southeast was above normal. The period from the 23rd to 26th was most severe on crops, there being extensive snow on the 23rd/24th and widespread air frost accompanied by sharp to severe ground frost on the 26th. Soil temperatures (100mm) varied from 0.1°C above normal at Mullingar 1.5°C above average at Malin Head.

Mean Duration of Bright Sunshine was above normal in most places for the first month since October or November. The southeast proved to be dullest relative to normal, there being only 85% of normal at Rosslare. Sunshine at Malin Head was 126% of normal and the average daily sunshine there during the second decade was 9.2 hours.

Gale Gusts occurred on the 12th, and from the 24th to the 27th.

Summary The month was dry and sunny with above normal temperatures in most places. However, it was rather cool with near normal rainfall in the east, and dull in the southeast.

The data contained in this Bulletin are provisional. Some of the material in Table 1 will be published in its final form later in the Monthly Weather Report; final values of Solar Radiation at stations; marked "e" in Table 2 will be published in the Annual Summary of Solar Radiation.
